

### Task 1.1P

This task involved the creation and development of a HTML page and adding various elements to it. Styling was also involved in the form of inline styles and an external stylesheet linked to the main .html file. This task allowed for the understanding and learning of elements such as table, form and image in addition to other elements which was utilized in the project. Some basic CSS styling was used such as size and border in order to change the way things look on the page. We created a github account and used it to create a repository in order to upload our work.
